AHS TRUST OUTBREAK REPORT – 28 February 2011

During the last 40 days, we have received reports of suspected cases of AHS from most parts of the country normally affected by AHS during outbreaks. The concerning fact is the number of cases reported.

In the six years that the AHS Trust has been reporting on outbreaks, this year has recorded the highest number of suspected cases up until the **9th of March 2011**. **Please note** - this is based on suspected cases reported but not yet substantiated by laboratory results or veterinary diagnosis.

The specific breakdown of cases reported by Province can be found on the table at the end of this report. We expect this outbreak could surpass records from the previous 6 years and might even have in excess of 1000 cases reported.

Western Cape Outbreak

The AHS Trust has to date NOT reported on the outbreak in the Western Cape due to agreements with the State Vet and Dept of Agric. Due to the sensitive nature of the outbreak we can only report it once all official testing, research and reporting to the various authorities has been completed. We expect this to be completed within days and only then will this information appear on our website.

All other infected areas

We have recorded outbreaks in most of the usual parts of the country except for the far north where it is reported to be exceptionally dry for this time of year. Of concern are the locations that have reported cases not usually associated with AHS outbreaks, especially at this time of the year. These include the following areas:

- Eastern Free State – Wakkerstroom, Memel, Bethlehem, Harrismith, Warden and Kestel
- Mpumalanga – Amersfoort
- Northern Cape – Hotazel, Vryburg, Kuruman

In Harrismith and surrounding areas, where no cases have been reported for the last 30 years, in excess of 150 cases have been mentioned by the local vet Dr Scheepers however only 32 cases have been reported to the Trust. This is an indicator of the underreporting that exists during outbreaks.

Typically suspected cases reported in March account for about 60% of the total received in the season. Therefore, it would be reasonable to expect an increase in suspected cases from this point onwards which also appears to fit the five-year cycle based on the history of AHS reporting.

Historically, the majority of cases are reported on average two weeks after the event which means that the number of cases from February and current will increase considerably.

Higher vaccination coverage in the rural areas of KZN and the Eastern Cape hopefully will reduce the impact in these areas. The AHS Trust inoculated 2500 horses in the blanket vaccination campaign of 2011.

This year, samples collected via the AHS Trust reporting system have been couriered to Equine Research Centre (ERC) which then splits them and delivers to the State laboratory, Onderstepoort Veterinary Institute (OVI). We are also supporting Deltamune with samples.

Research initiatives are reliant on field samples and horse owners are encouraged to send in as many samples as possible. Please contact Douglas Welsh on 082 9654082 in this regard.

Statistics of All Reported Cases for 2010/2011 Outbreak*

Early Warning Map | **Statistics**

Overall Outbreak Statistics	
Outbreak duration (months):	5
Total approved cases:	283
Number of horses that died:	189
Number of horses that survived:	94
Reported Cases by Province	
Cases in Gauteng:	60
Cases in Mpumalanga:	21
Cases in North-West Province	3
Cases in Free State:	58
Cases in Limpopo:	5
Cases in KwaZulu Natal:	84
Cases in Northern Cape:	33
Cases in Eastern Cape:	17
Cases in Western Cape:	0
Cases in Namibia:	0
Cases in Lesotho:	0
Cases in other countries:	2
Reported Cases by Month	
November 2010:	15
December 2010:	7
January 2011:	31
February 2011:	82
March 2011:	148
Information Last Updated on 09/03/2011
